ASM Team Project 2026

Prof. M. Oberhauser, Prof. G. Mallebrein (✉ georg.mallebrein@hs-esslingen.de)

Last edit March 20, 2026

This is a joint project together with students from our french partner university SUPMECA in Paris.

CONTENT

The system under study consists of a flat satellite to which an antenna and a radar (represented only by a box) should be added. Based on these extensions safety aspects have to be considered.

Step 1 [approx. 2 weeks]

Detail and plan working packages

Potential topics are:

- Compare features of a primarily mechanical system and a motorized system with emphasis on safety aspects
- Develop the locking system
- Create the system (2D or 3D)
- Adapt the 3D structure to 2D
- Identify the flatsat suitable for integrating this payload
- Integrate the system into the flatsat

Step 2 [approx. 10 weeks]

Work on specified working packages together in a french-german team

Step 3 [approx. 1 weeks]

Presentation of the results in Esslingen and Paris

Since travel expenses have to be covered by Erasmus, only European students can participate in a visit to France. Therefore the participation of European students would be preferred.

Further details have to be clarified with the french team members.

Conditions:

This project is offered to ASM students at Esslingen University. The work continues predecessor projects and has interfaces to other project teams. Weekly regular meetings take place in presence. According to the module handbook the required workload corresponds to 240h per student.
